Alerting Abstract WO A1

NOVELTY - A data processing unit processes parked related data which are the payment associated with one of the parking spaces. A wireless communication unit sends parked related data to another payment parking terminal after receiving processed parked related data. A data storing unit stores the parked related data of the payment parking terminal and of another payment parking terminal.

DESCRIPTION - A clock keeps the time of storage of parked related data. A user interface comprises an input and output unit for interacting with the payment parking terminal. A fee collection unit collects and associates payment with one of the parking spaces.

INDEPENDENT CLAIMS are also included for the following:

- A. a wireless point-to-point communication networked metered parking system for managing use of parking spaces; and
- B. a method for implementing wireless point-to-point communication networked metered parking system.

USE - Used in networked metered parking system for managing use of parking spaces.

ADVANTAGE - Provides low lag time, high redundancy, wide area network with point-to-point communication. Prevents critical data from being lost when payment parking terminal malfunction, or become damaged or disconnected from network. Enables other payment parking terminal to manage related parking spaces until one payment terminal is repaired. Attains low operational cost and high reliability.

DESCRIPTION OF DRAWINGS - The figure shows the schematic representation of operational components of a parking payment terminal.

English Abstract:

The networked metered parking system of the present invention uses a database distributed over a plurality of parking payment terminals (hereinafter referred to as standalones), which provides a low lag time, high redundancy, wide area network with point-to-point communication, standalones and portable terminals aid in the use, payment, maintenance, enforcement, management, and continuous auditing of the metered parking system of the present invention.

French Abstract:

Le systeme de parking a parcometres en reseau de la presente invention utilise une base de donnees repartie entre plusieurs bornes de paiement (ci-apres designees "bornes isolees") qui assure un faible temps de latence, une redondance elevee, la presence d'un reseau etendu a communication point-a-point, l'assistance a l'utilisation des bornes isolees ou portatives, le paiement, l'entretien, la mise en oeuvre, la gestion et la verification en continu du systeme de parking a parcometres de la presente invention.

Alerting Abstract WO A1

NOVELTY - The method involves monitoring a flame across a contiguous spectral range to detect light emitted by the flame, segmenting the contiguous spectral range into multiple discrete ranges, and respectively processing the detected light across each of the multiple discrete ranges to determine one characteristic of the flame.

DESCRIPTION - An INDEPENDENT CLAIM is also included for a flame scanner.

USE - For determining the characteristic of the flame.

ADVANTAGE - Reduces the cabling requirements for the flame scanner while maintaining suitable redundancy and integration to bus. Enables to detect flames produced by multiple types of fuels.

DESCRIPTION OF DRAWINGS - The figure shows simplified depiction of a flame scanner.

100 Flame scanner

101 Lens assembly

105 Fiber optic cable assembly

107a-107n Photodiodes

110 Detector head assembly

English Abstract:

Techniques for determining a characteristic of a flame are provided by the present invention. Provided are methods as well as devices (100). A flame is monitored across a contiguous spectral range to detect light emitted by the monitored flame. The contiguous spectral range is segmented into a plurality of discrete ranges, and detected light across each of the one or more of the plurality of discrete ranges is respectively processed to determine at least one characteristic of the flame.

French Abstract:

La presente invention concerne des techniques pour determiner une caracteristique d'une flamme. Des procedes sont prevus ainsi que des dispositifs (100). Une flamme est surveillee

sur un domaine spectral contigu pour detecter la lumiere emise par la flamme sous surveillance. Le domaine spectral contigu est segmente en une pluralite de domaines distincts, et la lumiere detectee sur le ou chaque domaine distinct parmi la pluralite de domaines distincts est respectivement traite pour determiner au moins une caracteristique de la flamme.
